RESOLUTE SAMANTHA

Additional groundwater resources for Bulla Bulling Minesite, WA

A groundwater exploration program was undertaken to establish additional process water supplies to meet minesite capacity expansion.

Existing prospects were reviewed. Four additional production bores were established to access groundwater resources within a concealed palaeochannel sequence at three locations chosen to minimise bore interference. A fifth bore was established at an abandoned borefield. All bores were test pumped.

Recommendations were made for sustainable yield and borefield operations.
